SELENIUM

SELENIUM is a free (open-source) automated testing framework used to validate web applications across different browsers and platforms. You can use multiple programming languages like Java, C#, Python etc to create Selenium Test Scripts. Testing done using the Selenium tool is usually referred to as Selenium Testing.

- ❖ Test scripts can be written in any of these programming languages: Java, Python, C#, PHP, Ruby, Perl & .Net
- ❖ Tests can be carried out in any of these OS: Windows, Mac or Linux
- ❖ Tests can be carried out using any browser: Mozilla Firefox, Internet Explorer, Google Chrome, Safari or Opera
- ❖ It can be integrated with tools such as TestNG & JUnit for managing test cases and generating reports
- ❖ It can be integrated with Maven, Jenkins & Docker to achieve Continuous Testing

- ❖ We can use Selenium only to test web applications. We cannot test desktop applications or any other software
- ❖ There is no guaranteed support available for Selenium. We need to leverage on the available customer communities
- ❖ It is not possible to perform testing on images. We need to integrate Selenium with Sikuli for image based testing
- ❖ There is no native reporting facility. But we can overcome that issue by integrating it with frameworks like TestNG or Junit

Selenium Installation Steps

- ❖ *Install Java SDK*
- ❖ *Install Eclipse*
- ❖ *Install selenium Driver file*
- ❖ *Configure eclipse ide with webdriver*
 - *Launch eclipse .exe*
 - *Create a new project file -> new -> java project*
 - *Give project name, location select an external jre, select your project option finish*
 - *Right click new project -> new package -> package name -> finish*
 - *Create a class*

- *New project ->properties -> java build path -> libraries
-> add external JARS*
- *Select file outside library folder -> apply and close*
- *Add all JAR file inside and outside the library*

CUCUMBER

Cucumber is a tool that supports Behaviour Driven Development (BDD). It offers a way to write tests that anybody can understand, regardless of their technical knowledge. In BDD, users (business analysts, product owners) first write scenarios or acceptance tests that describes the behaviour of the system from the customer's perspective, for review and sign-off by the product owners before developers write their codes. Cucumber use Ruby programming language.

Behaviour Driven Development (BDD)

BDD is a software development technique that has evolved from Test Driven Development which is an approach or programming

practice where the developer's write new code only when the automated test fails

BDD approach involves the usage of shared language that enhances communication between various tech and non-tech teams. Tests are more focused and based on the system behaviour.

/

Advantages of Cucumber

- 1. It is helpful to involve business stakeholders who can't easily read code*
- 2. Cucumber Testing focuses on end-user experience*
- 3. Style of writing tests allow for easier reuse of code in the tests*
- 4. Quick and easy set up and execution*
- 5. Efficient tool for testing*

How does cucumber testing work?

*When you run **Cucumber**, it reads in your specifications from plain-language text files called features, examines them for*

scenarios to **test**, and runs the scenarios against your system.
Each scenario is a list of steps for **Cucumber** to **work** through.
involve using an automation library/framework

Cucumber installation steps

- ❖ *Install ruby and DevKit*

- ❖ *Open the download file and accept license*

- ❖ *Select your installation directory*

- ❖ *Install Cucumber*

- *Type in ruby cmd "gem install cucumber" To verify cucumber is installed type "cucumber -version"*

- ❖ *Install RubyMine*

- *In setup window open -> next -> select directory -> next -> create desktop shortcut -> next -> install -> finish -> ok*

Evaluate for free -> Evaluate -> Accept license.

- ❖ *Install Webdriver*

- Start cmd with ruby cmd and install command "gem install water-webdriver".

OUTPUT

```
1 package google;
2
3 import java.util.concurrent.TimeUnit;
4
5
6
7
8 public class Gmaillogin {
9
10 public static void main (String [] args) {
11
12     System.setProperty("webdriver.chrome.driver", "D:\\chromedriver.exe");
13
14     WebDriver driver = new ChromeDriver();
15
16     driver.navigate().to("http://mail.google.com");
17     driver.manage().timeouts().implicitlyWait(5, TimeUnit.SECONDS);
18     driver.findElement(By.cssSelector("#identifierId")).sendKeys("thetester132@gmail.com");
19     driver.findElement(By.cssSelector("#identifierNext")).click();
20     driver.manage().timeouts().implicitlyWait(10, TimeUnit.SECONDS);
21     driver.findElement(By.name("password")).sendKeys("thetester@123", Keys.ENTER);
22     driver.manage().timeouts().implicitlyWait(5, TimeUnit.SECONDS);
23
24 }
25
26
27
28
29
```

terminated> Gmaillogin [Java Application] C:\Java\jre1.8.0_181\bin\javaw.exe (26-Mar-2020, 8:58:53 am)
